

Seat Belt Modification

We have had a few customers mention that their seat belt had come undone when moving side to side in their blokart.

Upon inspection we found that clothing, particularly loose/baggy clothing, can catch on the seat belt release latch which releases the buckle.

The solution is to bend the end of the latch down rather than up so it cannot catch on clothing.

The modification is very simple and can even be done without removing the seat belt from the kart;

1. Make a 10mm deep cut in a short length of 2x4 timber with a handsaw.
2. Insert the end of the latch and give it a tweak so the end of the latch is bent down rather than up.

Note: we will not be modifying the seat belts on new karts as some prefer to have the protruding latch, particularly those in colder climates so the seat belt can be quickly released when wearing gloves.
